

DETAILED INVESTMENT PROPOSAL

Concept Note

The full case for the EECA Lung Health Hub – a phased, evidence-based investment across nine countries in Eastern Europe & Central Asia.

DETAILED INVESTMENT PROPOSAL: THE EECA LUNG HEALTH HUB

[The cover framing — "Detailed Investment Proposal", the lead sentence, the date and contact line — is not in the doc, whose title is "Concept Note / Regional Lung Health Hub in EECA Countries".]

From Decision to Delivery: Advancing Political Certainty and Lung Health Security in Eastern Europe and Central Asia

Last updated: September 2026

Contact: alesia.matusevych@globaltbcaucus.org

Comparison edition. Same document as the clean version — nothing added, nothing removed. Everything marked in **red** is where it departs from the source concept note doc (170826_EECA_LH_Sovereignty_Hub_12_m), with the doc's own wording given in brackets. Black text is the doc's wording.

Not marked individually: the doc's typos and broken sentences are silently repaired throughout — "a strategic and locally-led *d* response", an executive-summary paragraph ending in a comma, the verbless sentence in 1.3, the broken construction in 1.4, and "from early 2025 onward..This".

This whole section is in no version of the doc.

IN BRIEF: TURNING POLITICAL DECISIONS INTO DELIVERED CARE, FASTER

The **Eastern Europe Central Asia (EECA) Lung Health Hub** is an action-oriented regional platform that helps countries turn political decisions on lung health into real action – faster and more effectively. It focuses on lung health as an entry point for strengthening health systems across Eastern Europe and Central Asia, combining policy intelligence, financing and implementation support.

Rather than creating another standalone initiative, the Hub is designed to work through existing national institutions and regional partnerships, helping countries turn evidence and commitments into funded, operational solutions.

EECA Lung Health Hub works through three connected functions:

Engine

An AI-supported tool that analyses legislation, helps prepare amendments, and speeds up parliamentary work on lung health – with dedicated human oversight ensuring coordination.

Bridge

A platform for direct regional parliamentary cooperation. It identifies common priorities and successful approaches across countries, and makes regional exchange more practical and accessible.

Shield

An early-warning and continuity system that alerts decision-makers to risks that could interrupt treatment, and supports practical measures to reduce differences in access to medicines.

The Hub starts with a *six-month Foundation Phase* in one country to test and prove the model, before expanding regionally. It works through existing institutions rather than creating parallel structures.

EXECUTIVE SUMMARY: A CATALYTIC TWO-YEAR PROGRAMME

[the doc has no tagline here]

A multi-sectoral programme that includes the development of an artificial intelligence application to help the region move more quickly from decisions to real results. The programme will provide more open access to the decision-making process for parliamentarians, civil society and affected communities. It also includes a system that uses regional data to identify where patients may lose access to treatment – and alerts decision-makers early.

The Eastern Europe and Central Asia (EECA) region faces a critical juncture. Persistent health epidemics, escalating geopolitical complexities, and a fundamental shift in global health financing demand a new paradigm: rapid, decisive action and national ownership. With major donors scaling back their funding commitments globally – and particularly across EECA since early 2025 – the region must urgently adapt to safeguard its health future.

This proposal focuses on lung health diseases – the leading cause of preventable deaths and a key driver of health system strain across the region, where tuberculosis, chronic respiratory conditions, and post-infection complications continue to threaten population health and economic stability.

This Detailed Investment Proposal outlines a strategic opportunity to support the EECA Lung Health Hub as a full-scale, high-impact program, structured as a phased programme over 2 years: a USD 100,000, 6-month Foundation Phase in one EECA country [doc: "a USD 70,000, 6-month Foundation Phase in Kazakhstan" — the \$70,000 was superseded when the team raised the Phase 1 ask] delivering a fully working solution, followed by country-by-country replication and regional build-out, to a total programme value of USD 1.2 million. Full phased budget and terms are

available on request. [doc: "to a total programme value of USD 1,210,000, with further details provided in subsequent sections" — no section of the doc provides them]

This Hub is designed as a fast, flexible engine to move from decision to delivery, giving politicians greater certainty and speeding up the rollout of essential lung health policies and services. It aims to tackle the common problem of "too many laws vs. too little implementation", which often slows progress in the region. Crucially, the Hub is building on a solid and proven foundation – it builds upon the established, high-impact infrastructure and deep relationships of the **Global TB Caucus**, a global network of parliamentarians working to drive political action, improve policies, and secure funding to end tuberculosis, active in the EECA region since 2014 [doc: 2014-2016]. This existing network, comprising nine active national caucuses (Armenia, Azerbaijan, Georgia, Kazakhstan, Kyrgyzstan, Moldova, Tajikistan, Ukraine, Uzbekistan), provides an unparalleled foundation for rapid, sustainable impact. Building on this political reach and trust, the Hub will leverage advanced digital and AI-enabled solutions to accelerate the translation of policy decisions into implementation. This will include tools such as AI-assisted legislative drafting and analysis (with mandatory human review) for MPs and a "Last-Mile Logistics Dashboard" for efficient distribution. Together, these innovations aim to significantly shorten the time between decision-making and execution, with the potential to reduce timelines to as little as one week in optimized settings.

Functioning as a **Health Security Coordination Center**, the Hub ensures continuity of care and integrated assistance for approximately 300,000 vulnerable patients across the EECA region who are affected by TB and other lung diseases (based on WHO and ECDC regional estimates available as of 2025). This is a conservative estimate based on the annual incidence of TB alone in the target countries, acknowledging that the broader scope of lung health diseases and co-morbidities significantly increases the number of beneficiaries.

This proposal details a high-impact pathway to strengthen lung health sovereignty, regional resilience, and sustainable national health systems across EECA, offering national partners, donors and private stakeholders a strategic, measurable, and timely investment in the region's health and stability.

1. THE OPPORTUNITY: NAVIGATING A NEW REALITY WITH URGENCY AND PRECISION

The EECA region is currently facing overlapping health, economic, and geopolitical challenges that demand a strategic and locally-led response.

1.1. Persistent Lung Health Crises: A Focused Imperative

The EECA region bears one of the world's highest burdens of tuberculosis, with 18 high-priority countries accounting for approximately 85% of the TB burden and 99% of the multidrug-resistant TB (MDR-TB) burden. Beyond TB, other critical lung health conditions, such as chronic respiratory diseases and emerging respiratory infections, further strain already fragile health systems. The Hub will focus on lung health diseases, reflecting both their disproportionate burden among key and vulnerable populations, and the high potential for impactful, targeted responses.

The three figures below are the doc's own, lifted out of the paragraph above as a graphic.

18

high-priority countries

85%

of the region's TB burden

99%

of MDR-TB burden

1.2. The Global Fund Transition: A Call for National Ownership

Major donors are substantially reducing their active engagement in the EECA region from early 2025 onward. This strategic pivot creates a critical funding gap and underscores the urgent need for EECA countries to transition towards sustainable national-level domestic financing for health. International donors are increasingly advocating for national ownership and the development of robust local funding mechanisms, placing the onus on regional advocates to secure and optimize internal resources. This transition presents a unique opportunity for national donors to step forward and champion a model of self-reliance. This proposal offers a concrete, ready-to-implement pathway to operationalize that shift through practical mechanisms and milestones, as well as demonstrable regional impact.

1.3. Geopolitical Instability and Health Security: The Unseen Crisis

Escalating geopolitical instability and security threats across the region, including continued full-scale aggression from Russia in Ukraine and other geopolitical threats beyond the region, compound the crisis. The decline in global health donor spending further exacerbates this vulnerability, particularly as the shrinking civic space and new restrictive legislation increasingly threaten people's safety. In the event of escalating conflicts or other geopolitical shocks, the Hub's proposed role as a Health Security Coordination Center becomes paramount, ensuring uninterrupted, coordinated assistance to all affected patients, regardless of the security context. This is a direct investment in regional stability and health security.

1.4. Decision Paralysis and Implementation Lag: The Regional Hesitation

Despite increasing health expenditures in many EECA countries, budgets often do not match the real disease burden because planning is fragmented, spending data are weak, and forecasting is limited. A significant challenge is often observed as "regional hesitation", where political systems struggle to move from commitment to concrete action on complex health issues. It also stems from the overwhelming legislative workload on parliamentarians – with an average MP facing a deluge of legislative acts, the capacity for swift, informed decision-making on complex health policies is severely hampered. This leads to decision paralysis and implementation lag, where critical health policies take months, if not years, to translate into tangible benefits for the population. Without robust data governance, standards, and privacy safeguards (aggregated / non-identifiable data only; ISO 27001-grade security; GDPR-equivalent protection; sovereign / in-region hosting; independent audit), the potential of digital health remains untapped, risking donor skepticism about "AI breakthroughs."

2. THE SOLUTION: THE EECA LUNG HEALTH HUB

The EECA Lung Health Hub is designed as a lean, high-impact Full-Scale Program, strategically focused on catalyzing political will, community empowerment, and data-driven policy reform within a **\$1.2 million [doc: \$1,200,000]** budget over 2 years. Our approach is built on the principle of regional ownership and sustainability, leveraging existing strengths and addressing critical gaps.

2.1. Building on Established Foundations: The Global TB Caucus Network

Unlike new initiatives that require extensive foundational work, the Hub benefits from the pre-existing, robust infrastructure of the Global TB Caucus. This network has been actively engaged in the EECA region since **2014 [doc: 2014-2016]**, cultivating strong relationships and a proven track record of mobilizing political commitment for lung health. The Hub will directly integrate and amplify the work of nine active national Global TB Caucuses in Armenia, Azerbaijan, Georgia, Kazakhstan, Kyrgyzstan, Moldova, Tajikistan, Ukraine, and Uzbekistan. These established relationships provide an unparalleled platform for rapid engagement and impact, significantly reducing start-up time and costs.

2.2. Lean, Autonomous Regional Governance Structure

The Hub will operate as an autonomous, regionally-led center, ensuring that decisions are made by and for the EECA context, while remaining strategically connected to the broader Global TB Caucus network. This lean structure is designed for agility, direct impact, and fostering regional ownership and accountability. It avoids bureaucratic overhead, allowing for efficient allocation of the **\$1.2 million [doc: \$1,210,000]** budget directly to programmatic activities.

Governance Model:

Governance rests on four operating bodies, coordinated by a **Regional Steering Committee** of Parliamentary Council, Civil Society Council, and regional technical-expert representatives, which sets strategic direction and ensures alignment with regional priorities: [rewritten. Doc: "Regional Steering Committee: Composed of representatives from the Parliamentary Council, Civil Society Council, and key technical experts from the region. This committee will provide strategic direction, oversight, and ensure alignment with regional priorities." In the doc this sits above a bulleted list of the four bodies; presenting it as one more bullet is what made it read as a fifth branch. The four bodies below are set as cards; their wording is the doc's]

Parliamentary Council

Drawing directly from the nine active national Global TB Caucuses (Armenia, Azerbaijan, Georgia, Kazakhstan, Kyrgyzstan, Moldova, Tajikistan, Ukraine, Uzbekistan), this council will champion legislative and policy reforms, advocate for domestic resource mobilization, and ensure political buy-in at the highest levels. Their established relationships and influence are critical for translating policy into action.

Advisory Board of Former MPs (Ex-MPs)

A specialized body of former parliamentarians with deep experience in health policy and legislative processes. This board will provide strategic mentorship to current caucus members, lead high-level diplomatic missions, and offer a "layer of certainty" through peer-to-peer political guidance.

Civil Society Council

Comprising representatives from key populations and civil society organizations across the EECA region, this council will ensure that the Hub's activities are community-led, rights-based, and responsive to the needs of vulnerable populations. It will provide ethical oversight, particularly for data use, and ensure accountability and transparency. The Council will work at the regional, national, and community levels, with key roles led by community-led representative networks and input from civil society gathered through regular community consultations.

Technical Secretariat

A small, agile team responsible for day-to-day operations, technical support, and efficient implementation of the program pillars. The Secretariat will include three core positions: Lead for Parliamentary Engagement, Lead for Civil Society Engagement, and AI & Systems Architecture Lead. In addition, several support operations positions will be included, such as finance, administration, communications, and AI & Systems Architecture Assistant.

This structure ensures that the Hub is deeply embedded within the regional political and social fabric, enabling swift, context-specific decision-making and implementation, while benefiting from the global expertise and network of the Global TB Caucus.

2.3. The \$1.2 Million Program: The EECA Lung Health Hub (2-Year Program)

Component 1: The Engine (AI-Powered Legislative Platform)

The doc reads "The Engine — App (AI-Powered Legislative Platform)" — a word is missing after the dash. The doc also sets all three components in a four-column table; at page width that produced rows a full page tall, so the same content is set as blocks.

Key function: Turn political decisions into ready-to-table legislation and budget action, faster implementation.

KEY DELIVERABLES (WITHIN 24 MONTHS)

- Secure MP Portal – role-based, invitation-only workspace to draft, compare and share laws & amendments
- AI-assisted drafting & amendment analysis – generates options and flags inconsistencies, with mandatory human review (AI is an enabling tool, not the decision-maker)
- Comparative-Law Intelligence – searchable, multi-country EECA health-legislation database
- Automated stakeholder & timeline mapping – MPs, committees, legislative windows
- Integrated community feedback loop
- No personally identifiable data; full audit trail

Result / value: Reduces routine legislative turnaround from months toward days – with traceable, governed, human-reviewed outputs.

Component 2: The Bridge – AI-Driven Diplomacy & Political Coordination

Key function: Promote targeted, evidence-driven political engagement and regional cooperation instead of ad hoc efforts.

KEY DELIVERABLES (WITHIN 24 MONTHS)

- Country-matching analytics – recommends bilateral cooperation from budgets, legislation, outcomes & readiness (AI-assisted, human-validated)
- Evidence-based bilateral & multilateral missions
- Regional Parliamentary Summits
- Decision Briefs (2–4 pages) for policymakers
- Budget & Policy Intelligence – budget reviews, costing models, resource mapping, spending alignment

Result / value: Turns diplomacy into a precision tool that links engagement to concrete policy and financing outcomes.

Component 3: The Shield – Health Security, Crisis Response & Continuity of Care

Key function: Keep care continuous and decision-makers informed during potential crises.

KEY DELIVERABLES (WITHIN 24 MONTHS)

- Regional health-security coordination protocol
- Continuity-of-care mapping (aggregated, non-identifiable data)
- Signal-based early-warning alerts for MPs (supply, displacement, funding disruptions)
- Interactive dashboards – disease burden + financing, regional/country views
- Supply & last-mile visibility dashboard – a data/visibility layer over supply status (not physical logistics execution)
- Privacy-by-design; aggregated indicators only

Result / value: Protects continuity of care and gives early, governed warning before care is interrupted.

Together these [doc: "The table above"] present the Hub as a single, integrated system rather than three separate projects. The Coordination Hub provides the backbone, the Engine accelerates policy action, the Bridge aligns diplomacy and financing, and the Shield protects health system continuity under stress. Together, these components are designed to move the region from political commitment to practical implementation much faster than conventional approaches.

All three components run on a shared, governed data layer – a common indicator model, interoperability standards (WHO digital-health aligned), validation/versioning, ISO 27001-grade security and sovereign / in-region hosting – which is what lets the Engine, Bridge and Shield share data safely.

3. THE INVESTMENT THESIS: HIGH-LEVERAGE, RAPID IMPACT FOR NATIONAL DONORS & PRIVATE PARTNERS

This **\$1.2 million [doc: \$1,210,000]** programme establishes a practical, evidence-based decision-support system for lung health in EECA – designed to help governments act on evidence, spend more efficiently, and maintain system continuity during a critical transition period.

With the regional withdrawals in 2026, the Hub serves as a bridge to national health sovereignty, ensuring that political commitments translate into sustained domestic action.

3.1. The Engine – Policy Certainty and Immediate Action

This component directly addresses one of the biggest structural gaps in the region: the absence of clear, actionable intelligence on how health resources are allocated and how policy decisions translate into financial commitments.

By equipping ministries, parliaments, and national stakeholders with Budget Review Reports, Resource Mapping Analyses, Policy Costing Models, and AI-assisted legislative drafting, the Engine enables:

- evidence-based decisions on domestic health financing
- credible costing of policy and legislative options
- stronger alignment between policies and national budgets
- reduced dependency on external technical assistance

Why it's investable: It strengthens core state functions – lawmaking, budgeting, and financial analysis – linking policy intent directly to realistic fiscal commitments and helping governments reduce inefficiencies while prioritizing high-impact interventions.

Impact: Political decisions move from concept to executable, financially grounded policy within days, providing unprecedented certainty and speed.

3.2. The Bridge – Smart Diplomacy and Financing Alignment

This layer ensures that regional collaboration and political engagement are no longer ad hoc, but strategically optimized through data, evidence, and structured accountability.

Building on the Global TB Caucus network and by linking budget data, legislative progress, and health outcomes, the Bridge:

- strengthens parliamentary engagement, oversight, and structured dialogue between government, civil society, and technical actors
- ensures missions and political platforms result in concrete policy, financing, and implementation outcomes
- provides budget advocacy toolkits, oversight systems, accountability scorecards, and Legislative and Budget Impact Notes

Why it's investable: It transforms existing political platforms (e.g., parliamentary networks) from advocacy spaces into effective delivery and accountability instruments, increasing transparency and ensuring funding decisions translate into real outcomes.

Impact: Regional cooperation and parliamentary processes become precision tools for accelerating national reforms, resource optimization, and sustained implementation.

3.3. The Shield – Health Security and System Resilience

In a region facing geopolitical instability and migration pressures, this component establishes practical operational intelligence that transforms fragmented data into usable insight for planning, forecasting, and continuity of care.

By integrating interactive dashboards, burden-versus-spending analyses, AI-supported forecasting models, and coordination mechanisms, the Shield:

- protects continuity of care and prevents treatment interruptions and drug resistance
- forecasts resource needs (drugs, diagnostics, service demand) and identifies inefficiencies

- enables rapid, coordinated crisis response and earlier risk identification

Why it's investable: It directly contributes to national stability, public trust, and health security by strengthening the capacity to monitor system performance, anticipate operational risks, and make coordinated resource decisions – without reliance on complex infrastructure.

Impact: Health systems become adaptive, crisis-ready, and capable of protecting vulnerable populations even in unstable conditions.

The Bottom Line: Rapid Execution and Decision Support

This is not a traditional program. It is a regional execution system that:

- converts evidence into actionable financing and policy decisions
- connects budget intelligence, operational monitoring, parliamentary accountability, and implementation tracking into one coherent system
- demonstrates a replicable model for national health sovereignty in the EECA region

Return on investment:

- Faster, financially grounded policy implementation
- Stronger planning, resource optimization, and continuity of care during the funding transition
- More transparent, accountable, and crisis-resilient health systems
- Demonstrated decision value across 2–3 pilot countries, with a clear roadmap for regional scale

Innovation: The Rapid Execution Cycle

The core innovation of the EECA Hub is the full integration of the Engine, Bridge, and Shield into a single, seamless execution flow – dramatically shortening the gap between political decision and tangible implementation.

- **Engine (Policy & Budget Intelligence):** An MP or ministry official drafts or amends legislation using AI-supported tools, with real-time access to budget analysis, policy costing, legal comparisons, and stakeholder input.

- **Bridge (Smart Diplomacy & Accountability):** The system automatically identifies relevant experiences from other countries, activates targeted parliamentary and political engagement, and generates supporting materials (budget impact notes, advocacy briefs, accountability scorecards).
- **Shield (Operational Intelligence & Health Security):** Approved decisions are immediately translated into operational dashboards, resource forecasting, procurement signals, and continuity plans – ensuring rapid operational follow-through.

Result: A fully connected decision-to-delivery loop that compresses what traditionally takes months (or even years) of fragmented efforts into a matter of weeks. Instead of disconnected initiatives, governments get an integrated system where evidence, political will, and operational capacity reinforce each other in near real-time.

4. CONCLUSION: A STRATEGIC INVESTMENT IN NATIONAL HEALTH AND REGIONAL STABILITY

By integrating:

- the Engine (AI-powered legislative platform),
- the Bridge (targeted political coordination), and
- the Shield (health security and delivery systems),

the Hub creates a single execution flow from policy → financing → patient impact.

Within 6 months (Phase 1), the investment delivers: a live Hub App core, a **national** [doc: "Kazakhstan"; the Russian doc adds "as pilot country; another country may be selected if needed"] screening-intelligence dashboard connected to national reporting, the Legislative Ask Map, and an active caucus legislative workplan – a working solution in one country.

Within 24 months, the investment delivers:

- A fully operational App enabling rapid legislative action
- Data-driven political cooperation that results in concrete reforms
- Real-time dashboards and logistics systems supporting delivery within one week for routine, templated actions in pilot settings
- Protected continuity of care for 300,000+ vulnerable patients

Why now: With the regional withdrawal in 2026 from global donors, countries need practical tools to manage health systems independently. The Hub provides exactly that – speed, structure, and accountability.

This is not a traditional program, but a working model of health sovereignty – helping governments act faster, use resources more efficiently, and maintain stability in uncertain conditions. We invite partners to invest in a system that delivers measurable results within two years and a scalable model beyond.
